(Particles)
histograms
Therminator3
Therminator3 (an EventProcessor)
thermal event generator on a freeze-out hypersurface (the models of Therminator 2): Monte Carlo integration of the Cooper–Frye integrand, multiplicities, emission of the particles with positions and momenta
ThermalModel (an EventProcessor)
static ideal hadron-resonance gas at T, μ, with feed-down; fills histograms, no events
ThermalHistos
densities and spectra of the species
ThermalDerivedHistos
derived quantities
Model
parameters (lengths in fm, T and μ in GeV), integrand and its maximum, clone(), volume of the sampled hypercube
ModelSettings
ModelTypes, CentralityTypes, FeedDownOption; numbers of draws
ThermalHadronGas
the hadrons of a ParticleDb; integrated multiplicities (ascii)
decay modes
Hypersurface
rapidity ranges, $\rho_{\max}$, τ_i, τ_c, volumes
models
ModelHadronGas (kHG)
ModelBlastWave (kBW)
ModelBWA (kBWA)
ModelHydro2D (kH2D)
ModelHydro3D (kH3D)
ModelKrakowSFO (kSFO)
ThermalHadronGasFD
feed-down of the resonances along their decay chains
ThermalHadron
a species: densities, energy, pressure, entropy, multiplicity, integrand max.
Thermodynamics
temperature (a ScalarField), chemistry, viscosity
hypersurface fields
Chemistry
chemical potentials (ScalarFields)
Viscosity (a ScalarField)
bulk Π and shear $\pi^{\mu\nu}$
ScalarField
